Ian Lumsden
UTK

Overall Tutorial Agenda (approximate)

Welcome and Introduction	15 min
Module 1: Performance measurement with Caliper	45 min
Module 2: Performance analysis with Thicket	30 min
Break	30 min
Module 2 (cont'd): Performance analysis with Thicket	20 min
Module 3: Reproducible experiments with Benchpark	60 min
Q&A and Wrapup	10 min

*Hands on component to accompany each module

Overall Tutorial Materials

Find these slides and associated scripts here:

- Caliper: <https://software.llnl.gov/Caliper/> under “Materials”
- Thicket: https://thicket.readthedocs.io/en/latest/tutorial_materials.html
- Benchpark: <https://software.llnl.gov/benchpark/basic-tutorial.html>

We also have a channel on Spack slack.

You can join here:

slack.spack.io

Join the #benchpark-support channel!

You can continue to ask questions here after the tutorial has ended.

Tutorial Instances: <http://bit.ly/4kGQDlc>

- We have an AWS instance for the hands-on component of this tutorial
- The instance provides:
 - Pre-installed Thicket, Caliper, and Benchpark and required dependencies
 - Caliper source code demos
 - Thicket Jupyter notebooks and datasets for performance analysis

When logging in to the instance:

- Please use a unique username to avoid resource allocation conflicts
 - First initial followed by last name (e.g., jdoe)
- PW: hpctutorial25

Performance Measurement with Caliper

David Boehme

Caliper: A Performance Profiling Library

2025 HPC Tutorial

July 20, 2025

David Boehme
Computer Scientist

Caliper: A Performance Profiling Library

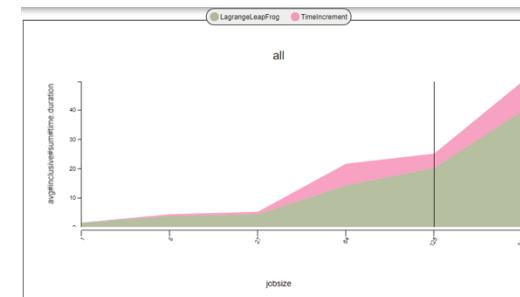

- Integrates a performance profiler into your program
 - Profiling is always available
 - Simplifies performance profiling for application end users
- Common instrumentation interface
 - Provides program context information for other tools
- Designed for HPC
 - Supports MPI, OpenMP, CUDA, HIP, Kokkos, RAJA

Caliper Use Cases

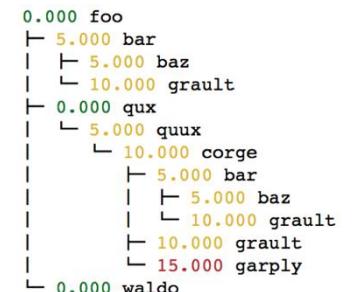

- Lightweight always-on profiling
 - Performance summary report for each run
- Performance debugging
- Performance introspection
- Comparison studies across runs
 - Performance regression testing
 - Configuration and scaling studies
- Automated workflows

Performance reports

Path	Min time/rank	Max time/rank	Avg time/rank	Time %
main	0.000119	0.000119	0.000119	7.079120
mainloop	0.000067	0.000067	0.000067	3.985723
foo	0.000646	0.000646	0.000646	38.429506

Using Caliper

Using Caliper: Workflow

Code Instrumentation

Runtime Configuration

Data Analysis

Region Profiling: Marking Code Regions

C/C++

```
#include <caliper/cali.h>

void main() {
    CALI_MARK_BEGIN("init");
    do_init();
    CALI_MARK_END("init");

    CALI_MARK_PHASE_BEGIN("hydro");
    do_hydro();
    CALI_MARK_PHASE_END("hydro");
}
```

Fortran

```
USE caliper_mod

CALL cali_begin_region('init')
CALL do_init()
CALL cali_end_region('init')
```

- Use annotation macros (C/C++) or functions to mark and name code regions

Region Profiling: Best Practices

- Be selective: Instrument high-level program subdivisions (kernels, phases, ...)
- Be clear: Choose meaningful names
- Start small: Add instrumentation incrementally

```
RAJA::ReduceSum<RAJA::omp_reduce, double> ompdot(0.0);

CALI_MARK_BEGIN("dotproduct");

RAJA::forall<RAJA::omp_parallel_for_exec>(RAJA::RangeSegment(0, N), [=] (int i) {
    ompdot += a[i] * b[i];
});
dot = ompdot.get();

CALI_MARK_END("dotproduct");
```

Caliper annotations give meaningful names to high-level program constructs

Instrumentation Support for RAJA and Kokkos

```
RAJA::dynamic_forall<policy_list>(pol, range,
    RAJA::expt::Reduce<RAJA::operators::plus>(&sum),
    RAJA::Name("RAJA dynamic forall reduction"),
    [=] RAJA_HOST_DEVICE (int i, VAL_INT_SUM &_sum) {
        c[i] = a[i] + b[i];
        _sum += 1;
    });
}
```

- RAJA now supports Caliper via optional RAJA::Name() parameter to label a kernel
- Caliper can also be used as a Kokkos profiling tool

Region Profiling: Printing a Runtime Report

```
$ cd Caliper/build  
$ make cxx-example  
$ CALI_CONFIG=runtime-report ./examples/apps/cxx-example
```

Path	Min time/rank	Max time/rank	Avg time/rank	Time %
main	0.000119	0.000119	0.000119	7.079120
mainloop	0.000067	0.000067	0.000067	3.985723
foo	0.000646	0.000646	0.000646	38.429506
init	0.000017	0.000017	0.000017	1.011303

- Set the CALI_CONFIG environment variable to access Caliper's built-in profiling configurations
- “runtime-report” measures, aggregates, and prints time in annotated code regions

List of Caliper's Built-in Profiling Recipes

Config name	Description
runtime-report	Print a time profile for annotated regions
loop-report	Print summary and time-series information for loops
mpi-report	Print time spent in MPI functions
sample-report	Print time spent in regions using call-path sampling
event-trace	Record a trace of region enter/exit events in .cali format
hatchet-region-profile	Record a region time profile for processing with hatchet or cali-query
hatchet-sample-profile	Record a sampling profile for processing with hatchet or cali-query
spot	Record a time profile for Thicket or TreeScape

Use `cali-query --help=configs` to list all built-in configs and their options

Built-In Profiling Recipes: Configuration String Syntax

Config name specifies the kind of performance measurement

Parameters enable additional features, metrics, or output options

```
$ CALI_CONFIG="runtime-report(mem.highwatermark,output=stdout)" ./examples/apps/cxx-example
```

Path	Min time/rank	Max time/rank	Avg time/rank	Time %	Allocated MB
main	0.000179	0.000179	0.000179	2.054637	0.000047
mainloop	0.000082	0.000082	0.000082	0.941230	0.000016
foo	0.000778	0.000778	0.000778	8.930211	0.000016
init	0.000020	0.000020	0.000020	0.229568	0.000000

- Most Caliper measurement recipes have optional parameters to enable additional features or configure output settings

Profiling Options: MPI Function Profiling

```
$ CALI_CONFIG=runtime-report,profile.mpi ./lulesh2.0
```

Path	Min time/rank	Max time/rank	Avg time/rank	Time %

cudaLaunchKernel	0.658269	0.682566	0.673030	4.053100
[...]				

The profile.cuda option measures time in CUDA runtime API calls

Use cali-query to get Help for Profiling Recipes

```
$ cali-query --help runtime-report
```

runtime-report

Print a time profile for annotated regions

Options:

aggregate_across_ranks	Aggregate results across MPI ranks
calc.inclusive	Report inclusive instead of exclusive times
cuda.gputime	Report GPU time in CUDA activities
exclude_regions	Do not take snapshots for the given region names/patterns.
include_branches	Only take snapshots for branches with the given region names.
include_regions	Only take snapshots for the given region names/patterns.
io.bytes	Report I/O bytes written and read
io.bytes.read	Report I/O bytes read
io.bytes.written	Report I/O bytes written
io.read.bandwidth	Report I/O read bandwidth
io.write.bandwidth	Report I/O write bandwidth
level	Minimum region level that triggers snapshots
main_thread_only	Only include measurements from the main thread in results.
max_column_width	Maximum column width in the tree display
...	

Sample Profiling

```
$ CALI_CONFIG=sample-report ./lulesh2.0
```

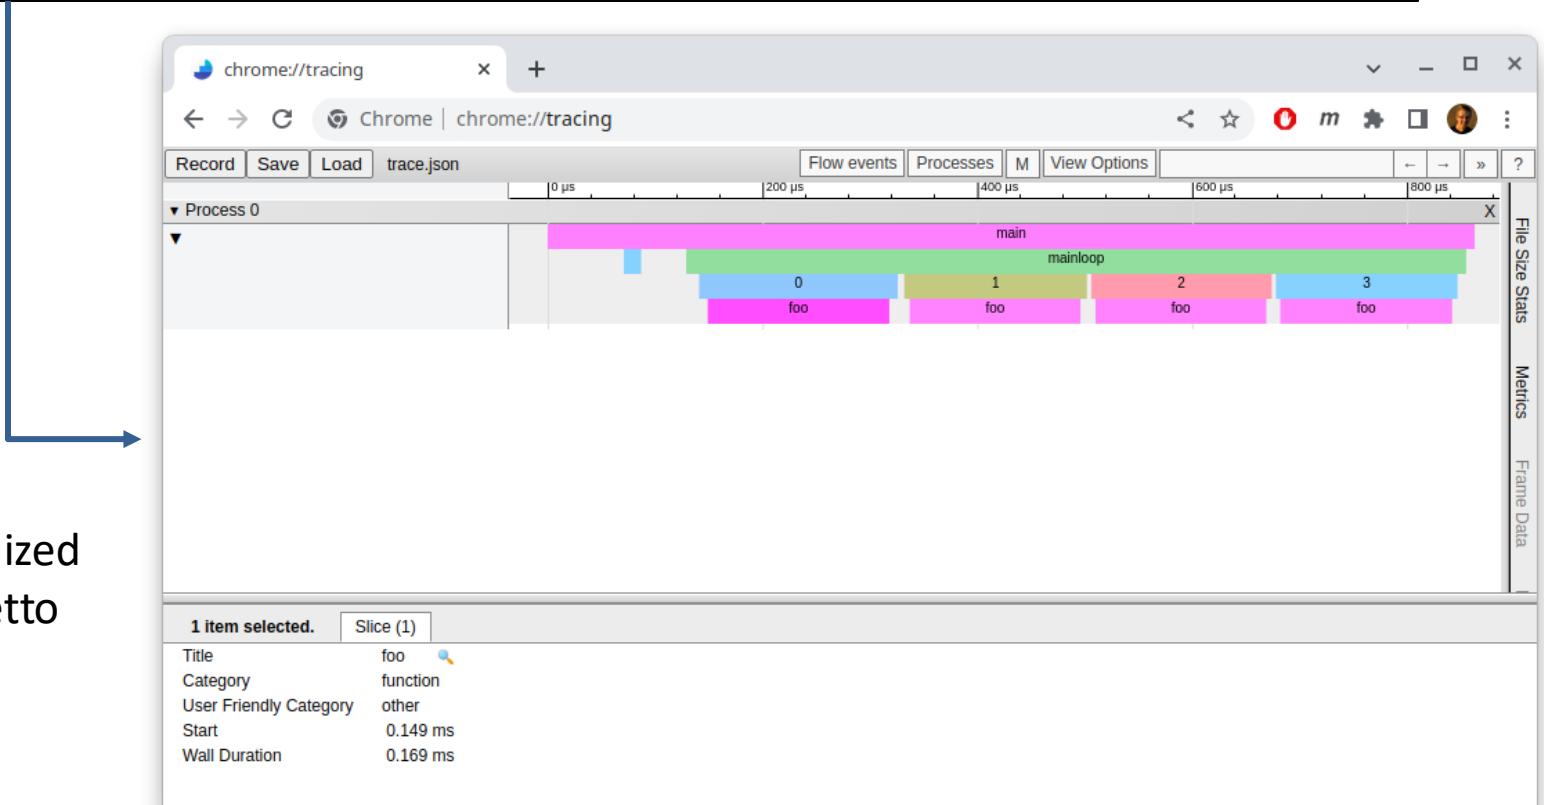

Path	Min time/rank	Max time/rank	Avg time/rank	Total time	Time %	Function
main						
-	0.005000	0.005000	0.005000	0.035000	0.059691	Domain::AllocateElemPersistent
-	0.005000	0.005000	0.005000	0.035000	0.059691	Domain::SetupThreadSupportStru
-	0.005000	0.005000	0.005000	0.005000	0.008527	sysmalloc
-	0.005000	0.005000	0.005000	0.005000	0.008527	Domain::BuildMesh(int, int, in
lulesh.cycle						
TimeIncrement						
-	0.075000	0.740000	0.355000	2.840000	4.843523	gomp_barrier_wait_end
-	0.005000	0.060000	0.027857	0.195000	0.332566	psm2_mq_ipeek2
-	0.005000	0.005000	0.005000	0.015000	0.025582	psm_no_lock

-	0.015000	0.030000	0.022143	0.155000	0.264347	mv2_shm_bcast
-	0.005000	0.025000	0.013750	0.055000	0.093801	amsh_poll
-	0.005000	0.010000	0.007500	0.030000	0.051164	psmi_poll_internal
...						

The *sample-report* recipe samples source functions or file+line locations.

Event Tracing and Timeline Visualization

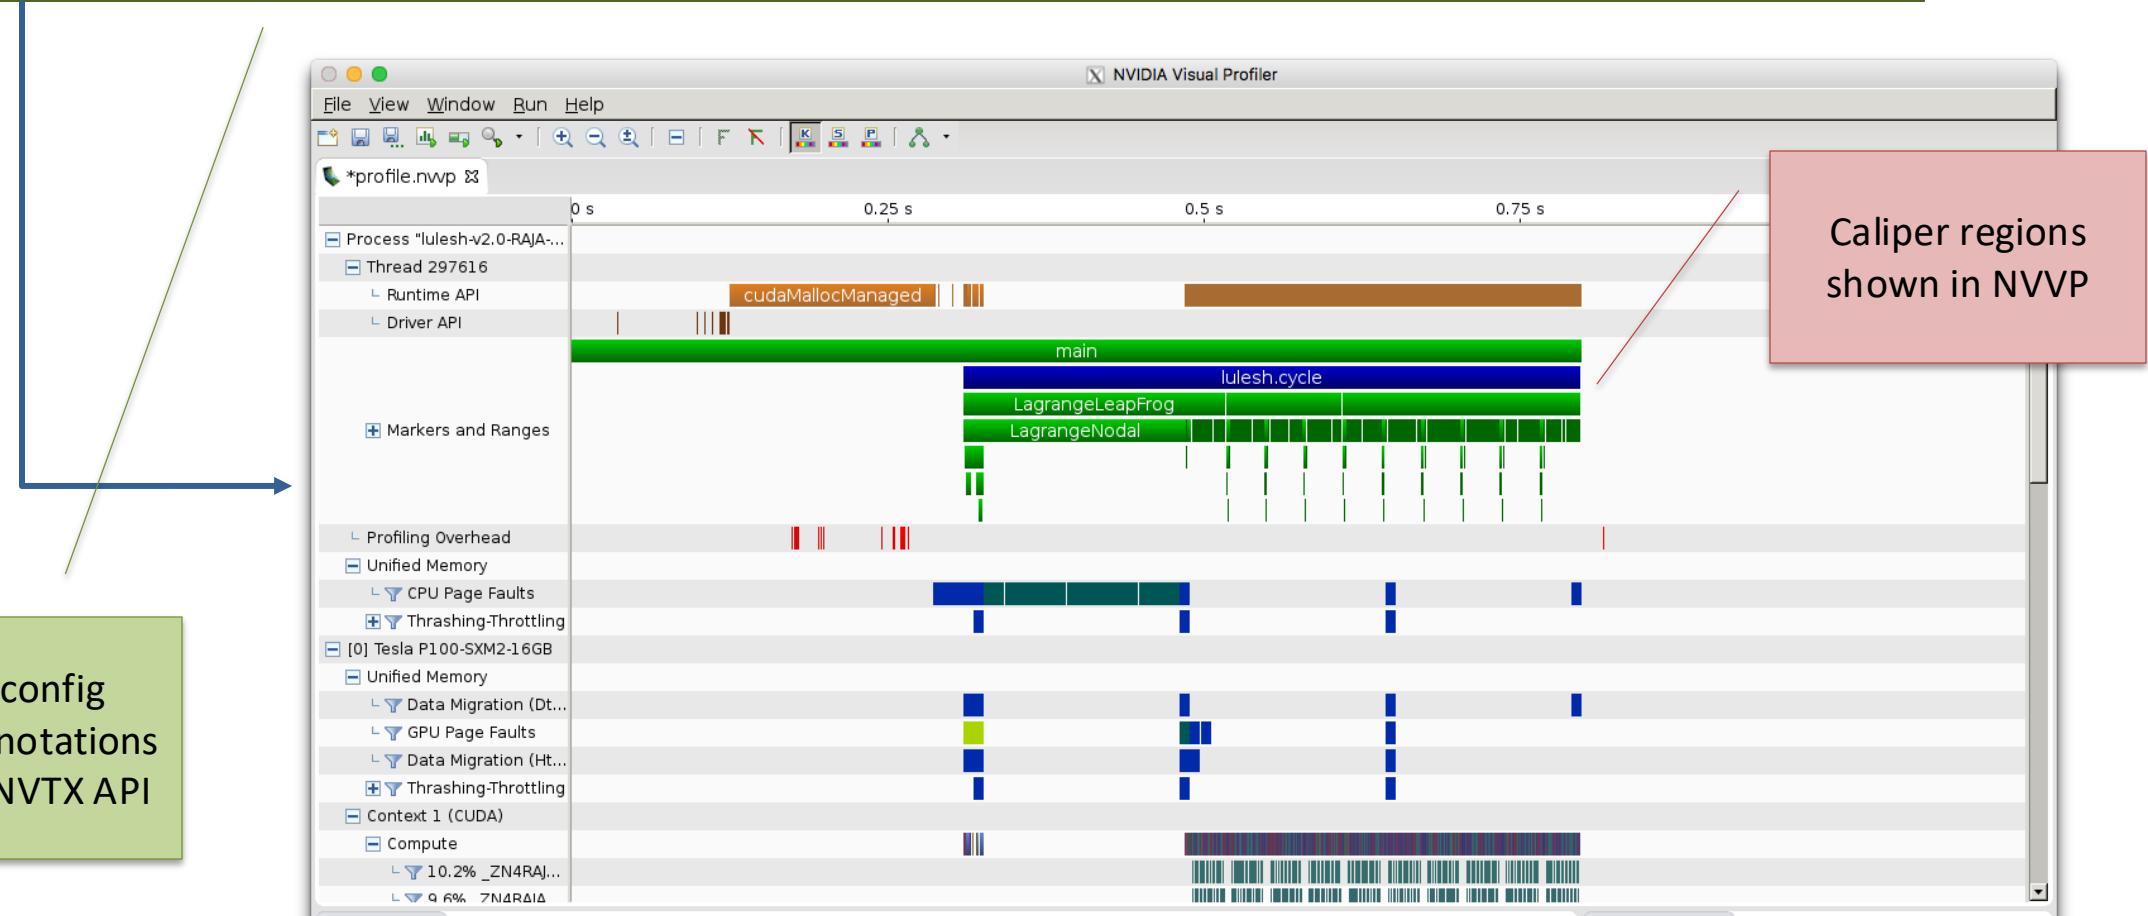

```
$ CALI_CONFIG=event-trace,output=trace.cali ./lulesh2.0  
$ cali2traceevent trace.cali trace.json
```

Caliper event traces can be visualized
in Chrome trace browser or Perfetto

Forwarding Annotations to Third-Party Tools

```
$ CALI_CONFIG=nvtx nvprof <nvprof-opt> ./app
```

Generating Reports with cali-query

```
$ mpirun -n 8 lulesh2.0 -P hatchet-region-profile,profile.mpi
$ cali-query -q "select mpi.rank,sum#sum#time.duration where mpi.function=MPI_Allreduce format tree"
region_profile.cali
```

Path	mpi.rank	time
main		
lulesh.cycle		
TimeIncrement		
MPI_Allreduce		
-	0	0.002174
-	1	0.083150
-	2	0.100689
-	3	0.171060
-	4	0.171347
-	5	0.204563
-	6	0.161819
-	7	0.203488

- Run SQL-like queries on Caliper output with the cali-query tool

Control Profiling Programmatically: The ConfigManager API

```
#include <caliper/cali.h>
#include <caliper/cali-manager.h>

int main(int argc, char* argv[])
{
    cali::ConfigManager mgr;
    mgr.add(argv[1]);
    if (mgr.error())
        std::cerr << mgr.error_msg() << "\n";

    mgr.start();
    // ...
    mgr.flush();
}
```

- Use ConfigManager to access Caliper's built-in profiling configurations

```
$ ./app runtime-report
```

- Now we can use command-line arguments or other program inputs to enable profiling

Manual Configuration Allows Custom Analyses

```
cali-query -q "select alloc.label#cuhti.fault.addr as Pool,  
cuhti.uvm.kind as UVM\ Event,  
scale(cuhti.uvm.bytes,1e-6) as MB,  
scale(cuhti.activity.duration,1e-9) as Time  
group by  
prop:nested,alloc.label#cuhti.fault.addr,cuhti.uvm.kind  
where cuhti.uvm.kind format tree" trace.cali
```

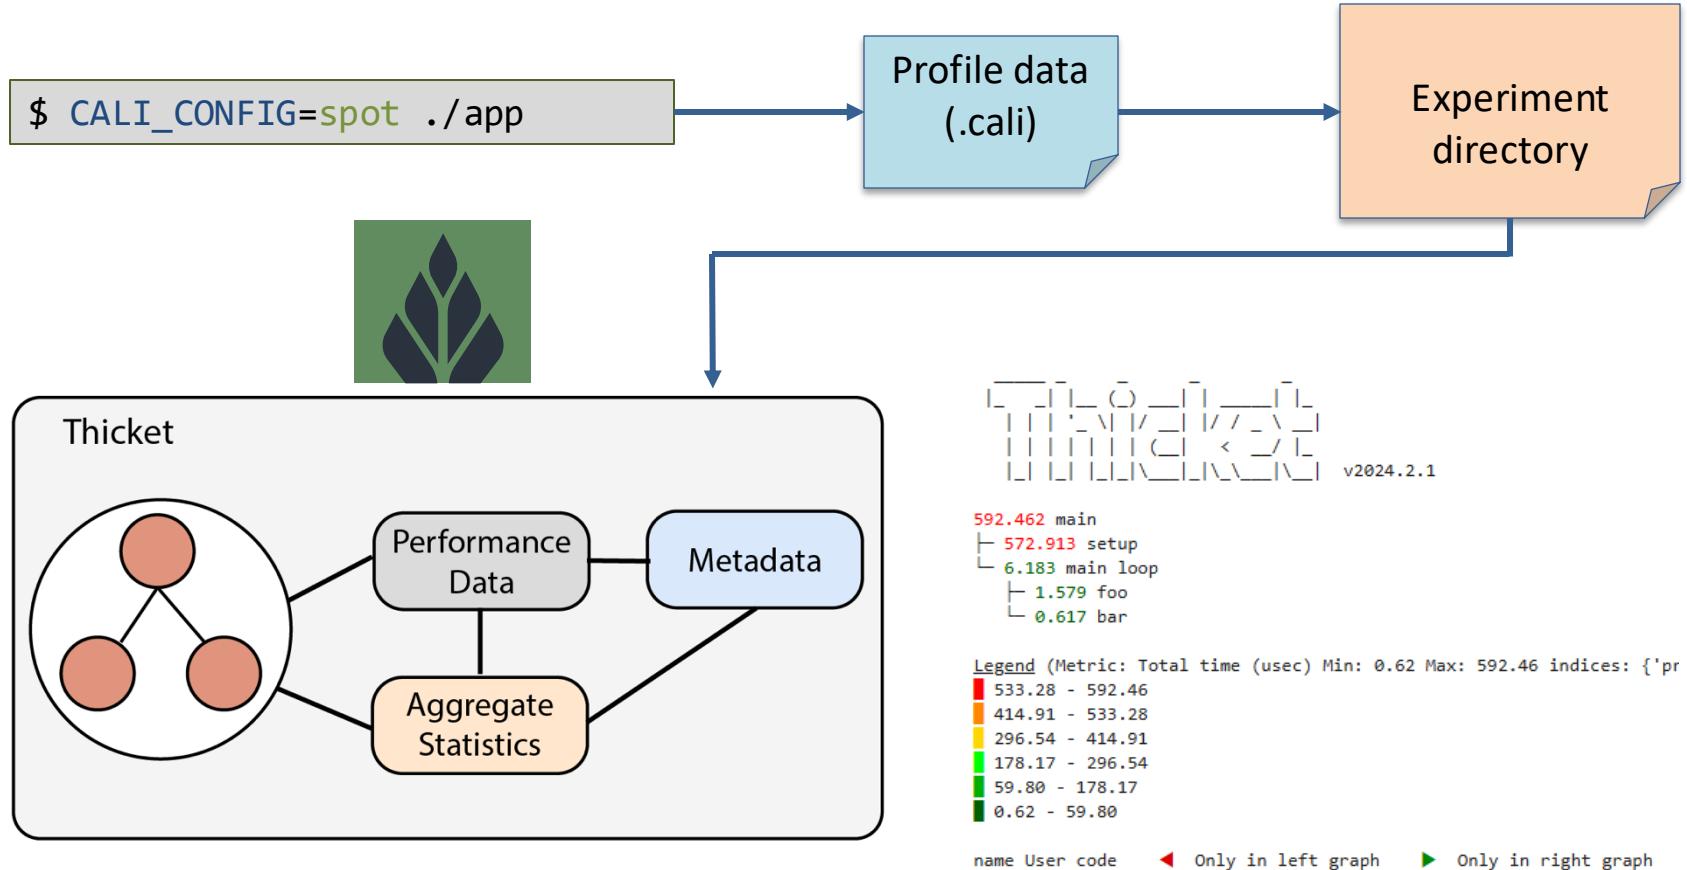

caliper.config

```
CALI_SERVICES_ENABLE=alloc,cuhti,cuhtitrace,mpi,trace,recorder  
CALI_ALLOC_RESOLVE_ADDRESSES=true  
CALI_CUHTI_CALLBACK_DOMAINS=sync  
CALI_CUHTITRACE_ACTIVITIES=uvm  
CALI_CUHTITRACE_CORRELATE_CONTEXT=false  
CALI_CUHTITRACE_FLUSH_ON_SNAPSHOT=true
```

Path				
main				
solve				
TIME_STEPPING				
enforceBC

curvilinear4sgwind UM_pool	DtoH	9986.441216	0.378583	
curvilinear4sgwind UM_pool	pagefaults.cpu			

- Mapping CPU/GPU unified memory transfer events to Umpire memory pools in SW4

Performance Comparison Studies with Thicket

Thicket: Exploratory Data Analysis in Python for large sets of runs

Recording Program Metadata with the Adiak Library

TeaLeaf_CUDA example [C++]

```
#include <adiak.hpp>

adiak::user();
adiak::launchdate();
adiak::jobsizes();

adiak::value("end_step", readInt(input, "end_step"));
adiak::value("halo_depth", readInt(input, "halo_depth"));

if (tl_use_ppcg) {
    adiak::value("solver", "PPCG");
// [...]
```

Use built-in Adiak functions to collect common metadata

Use key:value functions to collect program-specific data

- Use the [Adiak C/C++ library](#) to record program metadata
 - Environment info (user, launchdate, system name, ...)
 - Program configuration (input problem description, problem size, ...)
- Enables performance comparisons across runs. Required for SPOT and Thicket.

Adiak: Built-in Functions for Common Metadata

```
adiak_user();           /* user name */  
adiak_uid();           /* user id */  
adiak_launchdate();   /* program start time (UNIX timestamp) */  
adiak_executable();   /* executable name */  
adiak_executablepath();/* full executable file path */  
adiak_cmdline();      /* command line parameters */  
adiak_hostname();     /* current host name */  
adiak_clustername();  /* cluster name */  
  
adiak_job_size();     /* MPI job size */  
adiak_hostlist();     /* all host names in this MPI job */  
  
adiak_walltime();     /* wall-clock job runtime */  
adiak_cputime();      /* job cpu runtime */  
adiak_systime();      /* job sys runtime */  
  
adiak_collect_all();  /* everything */
```

- Adiak comes with built-in functions to collect common environment metadata

Adiak: Recording Custom Key-Value Data in C++

C++

```
#include <adiak.hpp>

vector<int> ints { 1, 2, 3, 4 };
adiak::value("myvec", ints);

adiak::value("myint", 42);
adiak::value("mydouble", 3.14);
adiak::value("mystring", "hi");

adiak::value("mypath", adiak::path("/dev/null"));
adiak::value("compiler", adiak::version("gcc@8.3.0"));
```

- Adiak supports many basic and structured data types
 - Strings, integers, floating point, lists, tuples, sets, ...
- `adiak::value()` records key:value pairs with overloads for many data types

Adiak: Recording Custom Key-Value Data in C

C

```
#include <adiak.h>

int ints[] = { 1, 2, 3, 4 };
adiak_namevalue("myvec",    adiak_general, NULL, "[%d]", ints, 4);

adiak_namevalue("myint",    adiak_general, NULL, "%d", 42);
adiak_namevalue("mydouble", adiak_general, NULL, "%f", 3.14);
adiak_namevalue("mystring", adiak_general, NULL, "%s", "hi");

adiak_namevalue("mypath",   adiak_general, NULL, "%p", "/dev/null");
adiak_namevalue("compiler", adiak_general, NULL, "%v", "gcc@8.3.0");
```

- In C, `adiak_namevalue()` uses `printf()`-style descriptors to determine data types

Live Demo

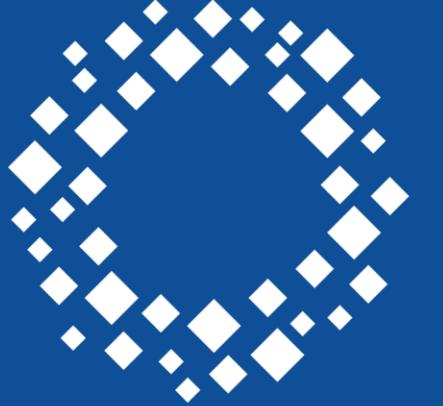

Tutorial Instances: <http://bit.ly/4kGQDlc>

- We have an AWS instance for the hands-on component of this tutorial
- The instance provides:
 - Pre-installed Thicket, Caliper, and Benchpark and required dependencies
 - Jupyter notebooks
 - Datasets for performance analysis

Tutorial Getting Started

Presentation slides: https://thicket.readthedocs.io/en/latest/tutorial_materials.html

Tutorial Agenda

- Welcome and overview
- Presentation (with slides)
- Hands-on session (AWS instance)

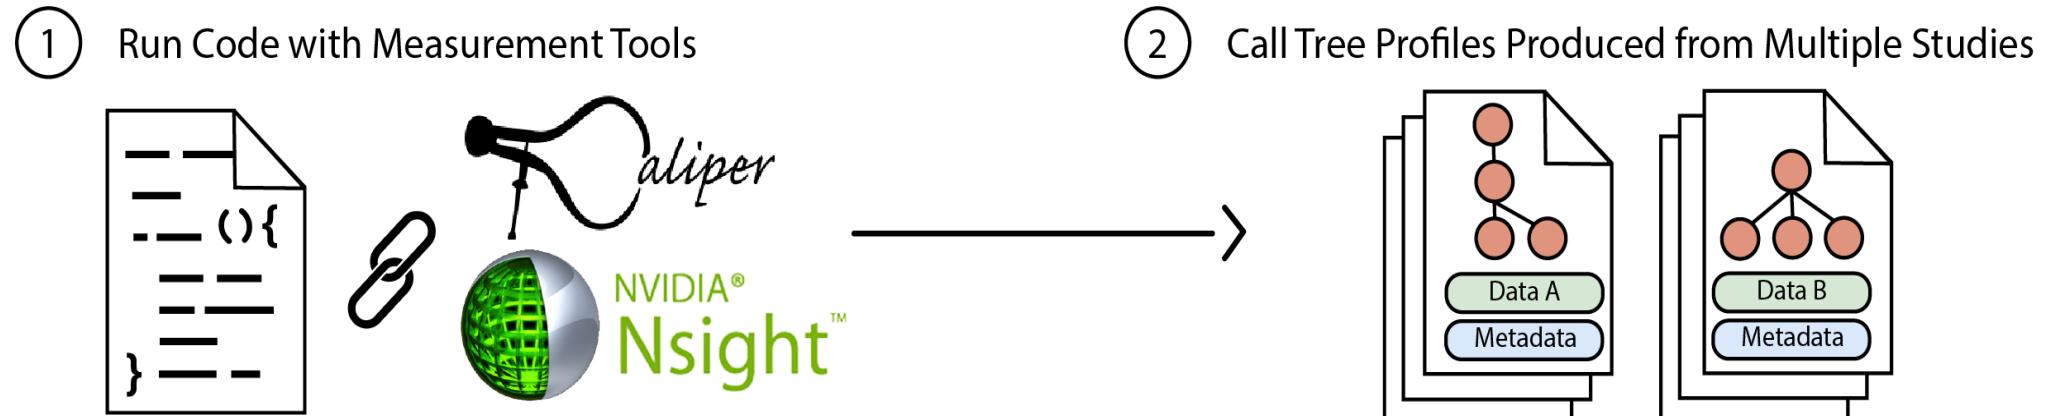

The screenshot shows a documentation page for 'Tutorial Materials'. At the top is a navigation bar with a logo, a search bar, and links for 'USER DOCS' (Getting Started, User Guide, Generating Profiling Datasets) and 'TUTORIALS' (Tutorial Materials, Basic Thicket Tutorial: Thicket 101, Clustering RAJA Performance Suite, Dataset: Thicket Tutorial). Below the navigation is a main content area titled 'Tutorial Materials' with a sub-headline about an in-person event at HPDC 2025. It includes a thumbnail of a presentation slide, a 'Download Slides' button, and a note about an AWS instance with Jupyter notebooks. Navigation buttons for 'Previous' and 'Next' are at the bottom.

AWS instance included in the tutorial materials provides:

- Pre-installed Thicket and required dependencies
- Jupyter notebooks and associated datasets for analysis

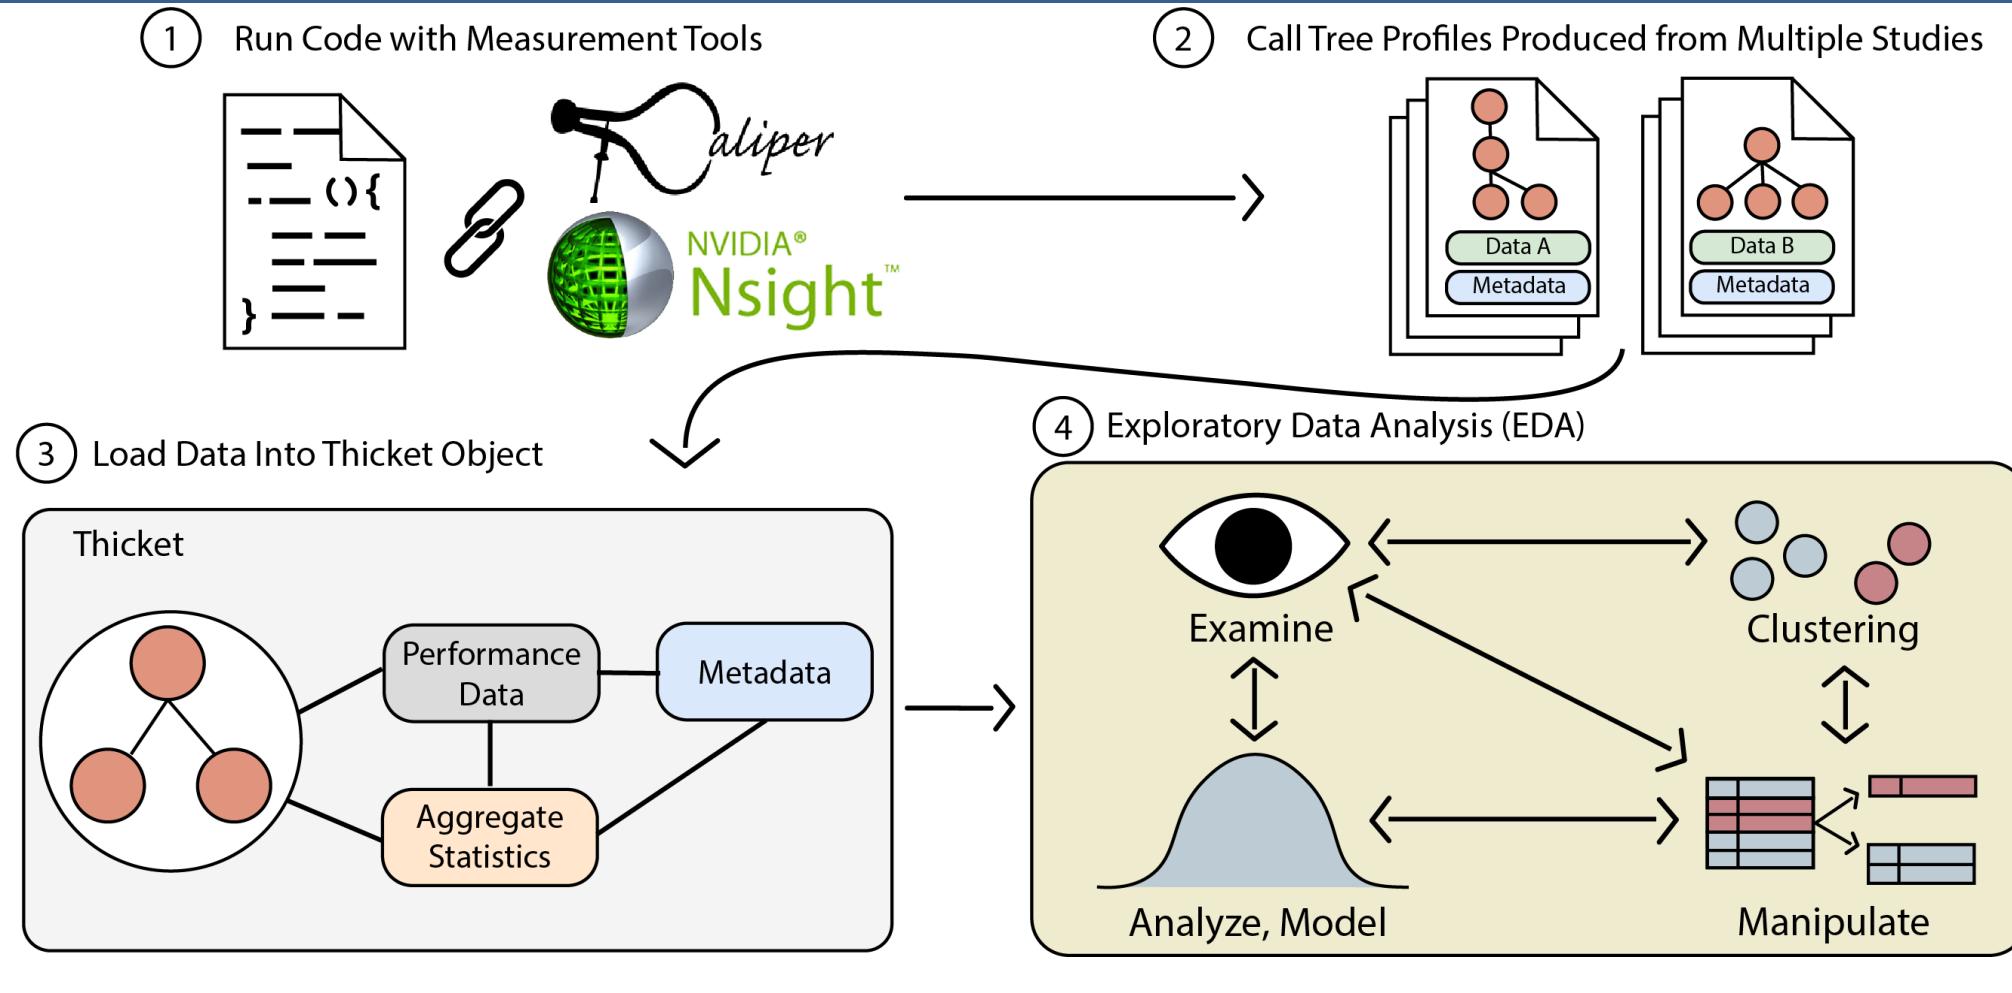

Challenge: Performance analysis in complex HPC ecosystem

- HPC software and hardware are increasingly complex. Need to understand:
 - Strong scaling and weak scaling of applications
 - Impact of application parameters on performance
 - Impact of choice of compilers and optimization levels
 - Performance on different hardware architectures (e.g., CPUs, GPUs)
 - Different tools to measure different aspects of application performance

Goal: Analyze and visualize performance data from different sources and types

Our big picture solution for analyzing and visualizing performance data from different sources and type

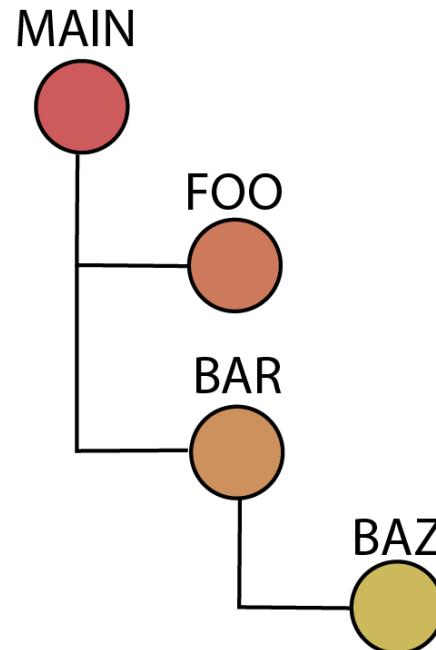

<https://github.com/LLNL/thicket>

<https://github.com/LLNL/thicket-tutorial>

What do profiling tools collect per run?

1) Call Tree

2) Performance data

Node	Cache Misses
MAIN	
FOO	
BAR	
BAZ	

- Time, FLOPS
- Cache misses
- Memory accesses

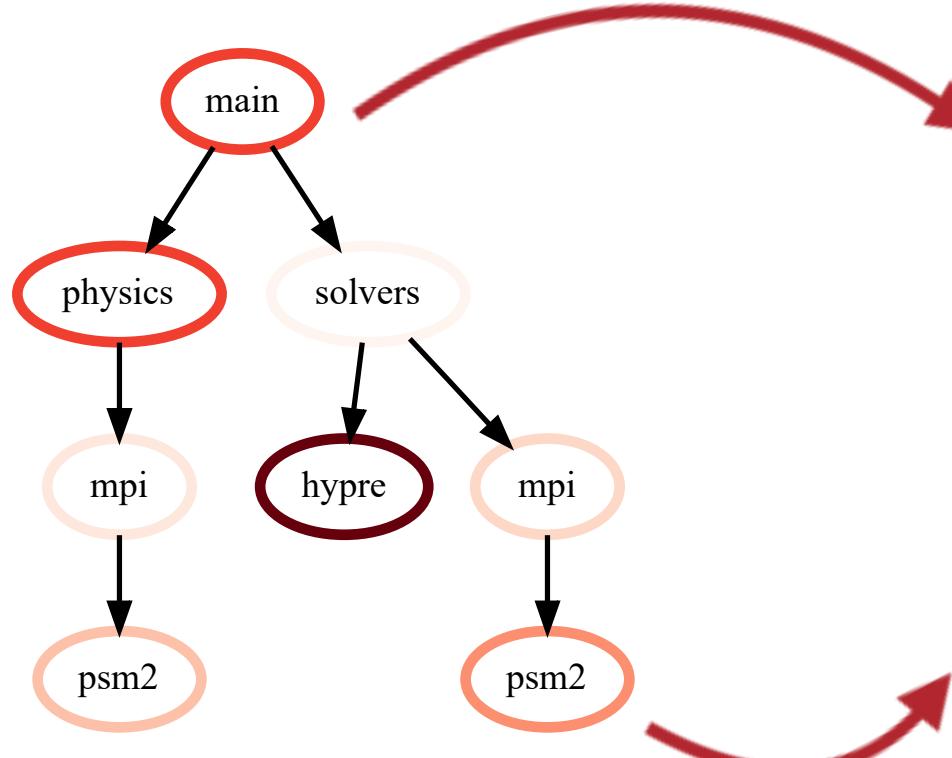

3) Metadata per run

User	Platform

- Batch submission (user, launch date)
- Hardware info (platform)
- Build info (compiler versions/flags)
- Runtime info (problem parameters, number of MPI ranks used)

Thicket builds upon Hatchet's *GraphFrame*: a Graph and a Dataframe

Graph: Stores relationships between parents and children

	name	nid	node	time	time (inc)
node					
main	main	0	main	40.0	200.0
physics	physics	1	physics	40.0	60.0
mpi	mpi	2	mpi	5.0	20.0
psm2	psm2	3	psm2	15.0	15.0
solvers	solvers	4	solvers	0.0	100.0
hypre	hypre	5	hypre	65.0	65.0
mpi	mpi	6	mpi	10.0	35.0
psm2	psm2	7	psm2	25.0	25.0

Pandas Dataframe: 2D table storing numerical data associated with each node (may be unique per rank, per thread)

<https://github.com/LLNL/hatchet>
<https://github.com/LLNL/hatchet-tutorial>

Visualizing Hatchet's GraphFrame components

```
>>> print(gf.tree()) # print graph  
>>> print(gf.dataframe) # print dataframe
```

```

Compare GraphFrames using division (or add, subtract, multiply)

```
>>> gf3 = gf1 / gf2 # divide graphframes
```

*First, unify two trees since
structure is different

```
>>> gf3 = gf1 + gf2 # add graphframes  
>>> gf3 = gf1 - gf2 # subtract graphframes  
>>> gf3 = gf1 * gf2 # multiply graphframes
```

Thicket enables exploratory data analysis of multi-run data

③ Load Data Into Thicket Object

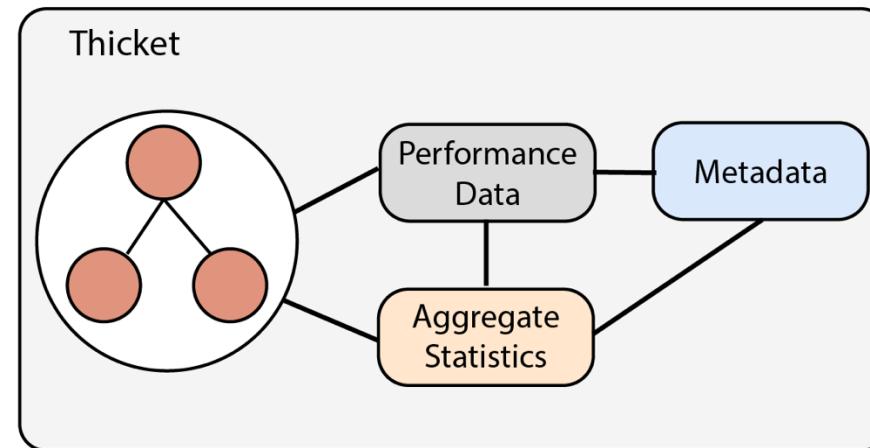

- Compose data from diff. sources and types
 - Different scaling (e.g., strong, weak)
 - Different application parameters
 - Different compilers and optimization levels
 - Different hardware types (e.g., CPUs, GPUs)
 - Different performance tools

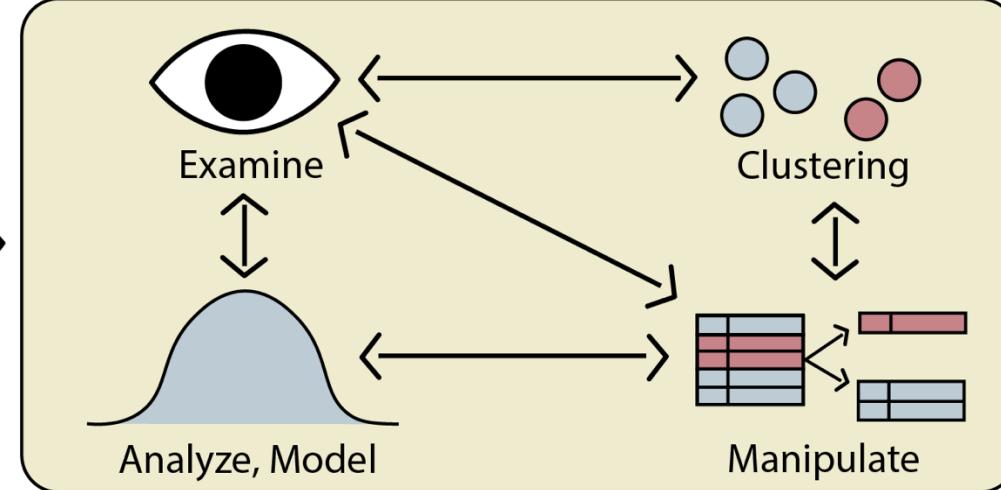

Thicket enables exploratory data analysis of multi-run data

3 Load Data Into Thicket Object

4 Exploratory Data Analysis (EDA)

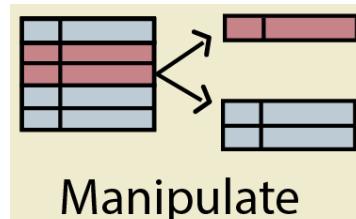

- Compose data from diff. sources and types
 - Different scaling (e.g., strong, weak)
 - Different application parameters
 - Different compilers and optimization levels
 - Different hardware types (e.g., CPUs, GPUs)
 - Different performance tools
- Perform analysis on the thicket of runs
 - Manipulate the set of data
 - Visualize the dataset
 - Perform analysis on the data
 - Model data
 - Leverage third-party tools in the Python ecosystem

- Open-source suite of loop-based kernels commonly found in HPC applications showcasing performance of different programming models on different hardware
- 560 runs/profiles:
 - 2 clusters (CPU, CPU+GPU)
 - 4 problem sizes
 - 3 compilers, 4 optimizations
 - 3 programming models (sequential, OpenMP, CUDA)
 - 3 performance tools (Caliper, PAPI, Nsight Compute)

    └ 0.003 Algorithm_REDUCE_SUM.block_128
```

Output call tree

I Lumsden et al. “Enabling Call Path Querying in Hatchet to Identify Performance Bottlenecks in Scientific Applications”, e-Science 2022

Visualize: Intel CPU top-down analysis

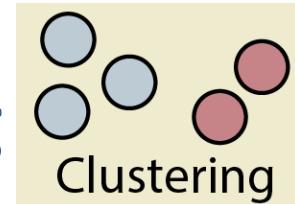

- *Top-down analysis* uses HW counters in a hierarchy to identify bottlenecks*
- Use Caliper's top-down module to derive top-down metrics for call-tree regions

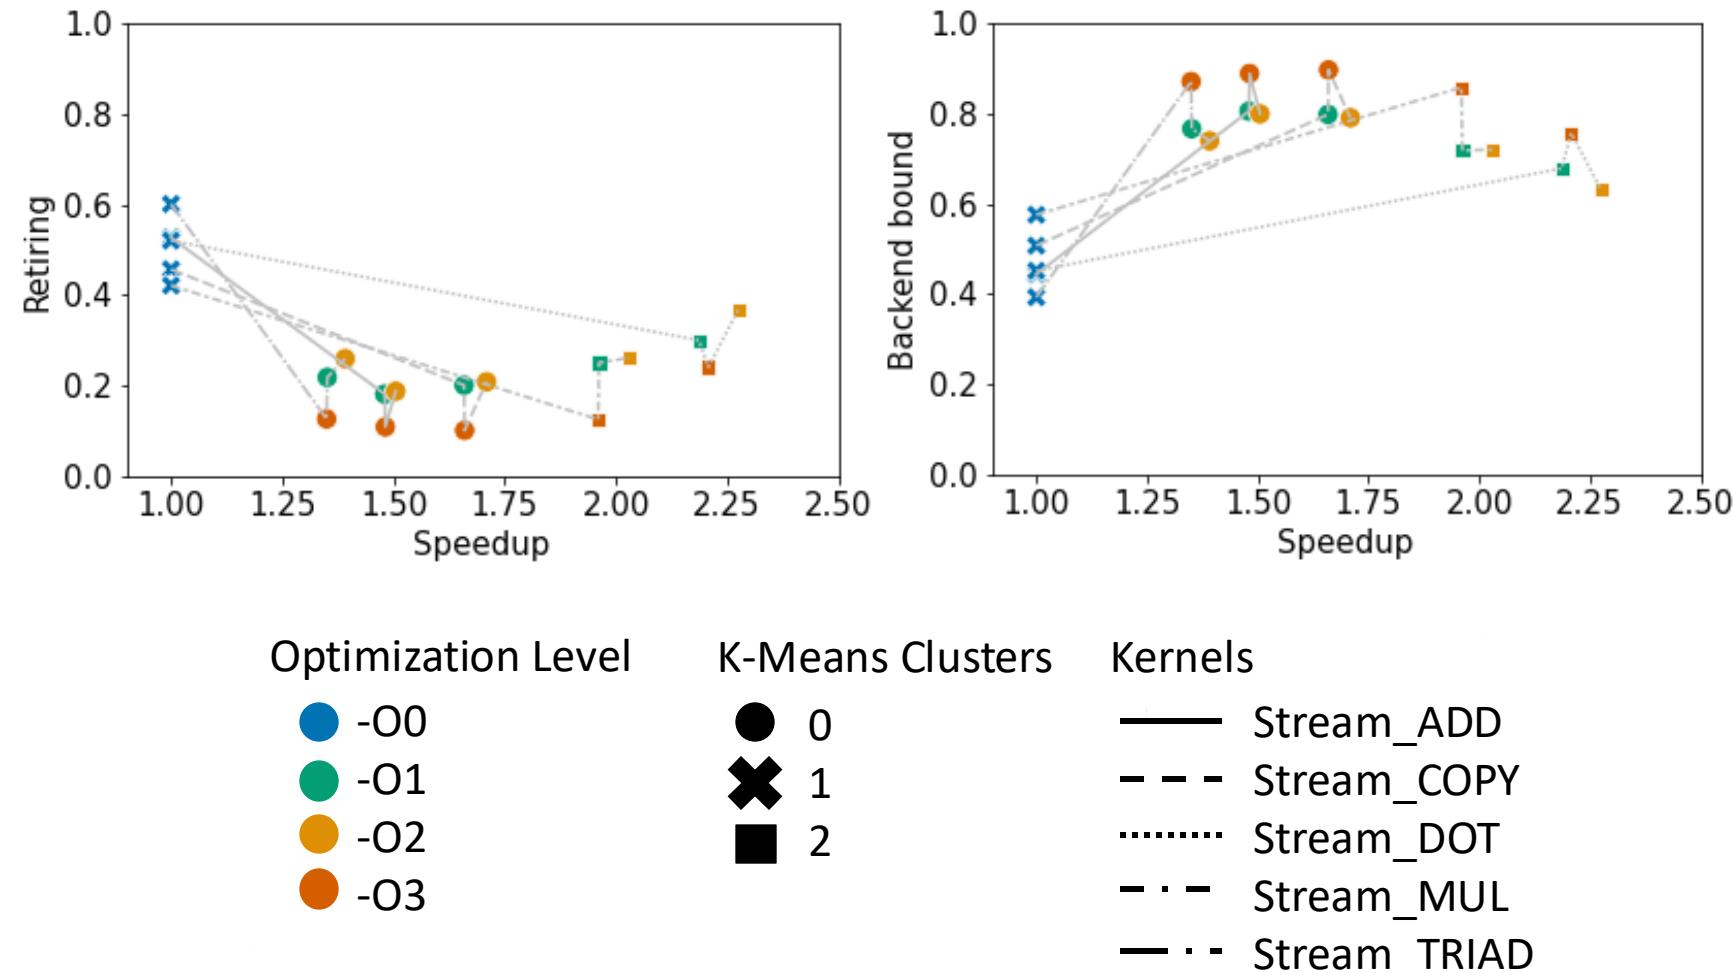

- Thicket's *tree+table* visualization shows top-down metrics as stacked bar charts, each bar is a profile
 - Apps_VOL3D has the highest retiring rates
 - Lcals_HYDRO and Stream_DOT become more backend bound as problem size grows

* Yasin, A.: A Top-Down Method for Performance Analysis and Counters Architecture. In: 2014 IEEE International Symposium on Performance Analysis of Systems and Software (ISPASS). pp. 35–44. IEEE, CA, USA (Mar 2014).

Use third-party Python libraries, e.g., Scikit-learn clustering

1. Select data of interest
 - Filter 8M problem size
 - Use query language to extract all implementations of the Stream kernel
2. (optional) Normalize data
3. Apply scikit-learn clustering to top-down analysis metrics of runs with different compiler optimization levels

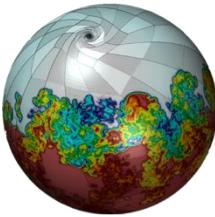

30 Min Break

Performance Analysis with Thicket II

Stephanie Brink

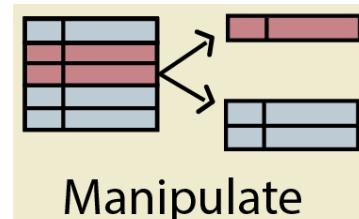

Case Study 2: MARBL multi-physics code

- MARBL is a next-generation multi-physics code developed at LLNL
- 60 runs/profiles:
 - 2 clusters (rztopaz, AWS ParallelCluster)
 - 2 MPI libraries (impi, openmpi)
 - 6 node/rank counts
 - 5 repeat runs per config

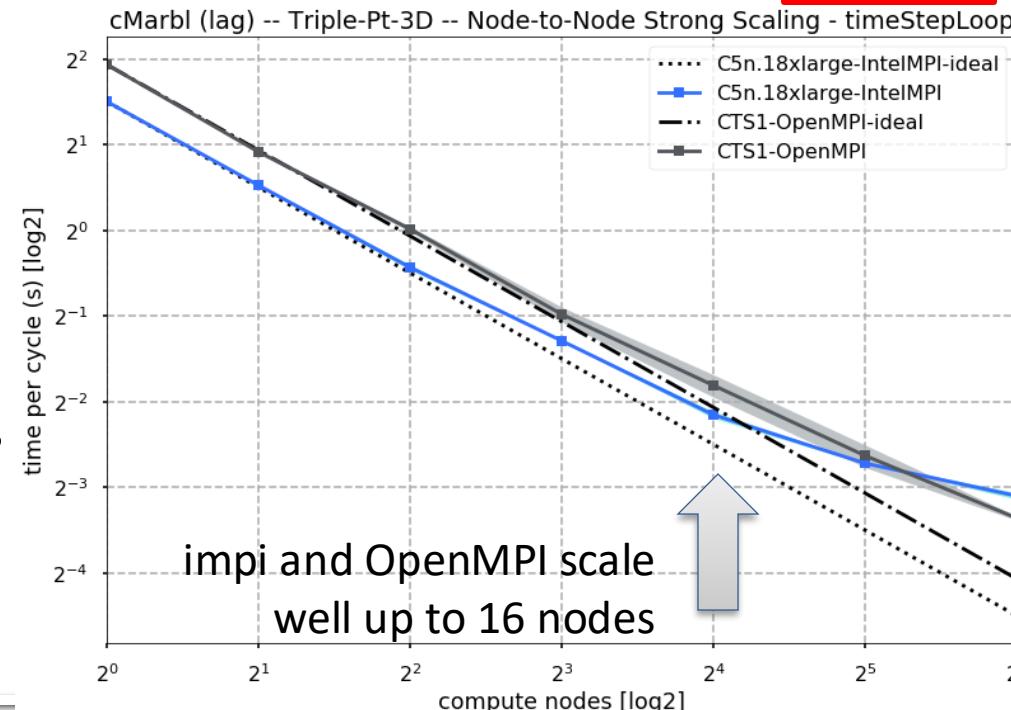

cluster	ccompiler	mpi	version	numhosts	mpi.world.size	#profiles
0 ip----	/usr/tce/packages/clang/clang-9.0.0	impi	v1.1.0-203-gcb0efb3	[1, 2, 4, 8, 16, 32]	[36, 72, 144, 288, 576, 1152]	30
1 rztopaz	/usr/tce/packages/clang/clang-9.0.0	openmpi	v1.1.0-201-g891eaf1	[1, 2, 4, 8, 16, 32]	[36, 72, 144, 288, 576, 1152]	30

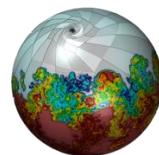

Manipulate: Compute noise and scaling

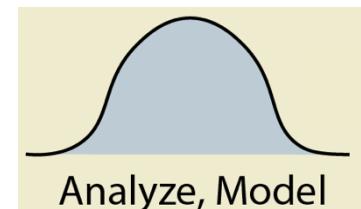

node	profile	Total time	name	mpi.world.size
{'name': 'main', 'type': 'function'}	-8554409769265002864	58036.664552	main	144
	-7335101512240609798	55318.808836	main	36
	-6029692086108825020	156984.246813	main	2304
	-5606382734792961361	64122.371533	main	288
	-4058809097109060732	155040.998627	main	2304
	-3193575964635936033	71010.504038	main	576
	-2978339073585311581	55910.708449	main	72
	-2939704488254773514	157934.204076	main	2304
	-2771797711381234985	56893.512948	main	144
	-2638513839856695106	97432.260966	main	1152

node	profile	Total time	name	mpi.world.size
	{'name': 'main', 'type': 'function'}		-7335101512240609798	55318.808836
			-843517585394879415	55110.656885
			7720382918482619866	55155.581578
			8293335926964337960	55139.134916
			8335957980556391465	55013.682102

1. Use groupby(MPI.world.size) to generate unique subsets of data which are repeated runs; compute noise
2. Compose runs on different platforms and at different scales
3. Generate strong scaling plot with matplotlib
 - Deviation shown in shaded region, dots are average of 5 runs

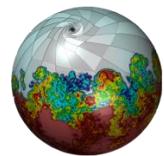

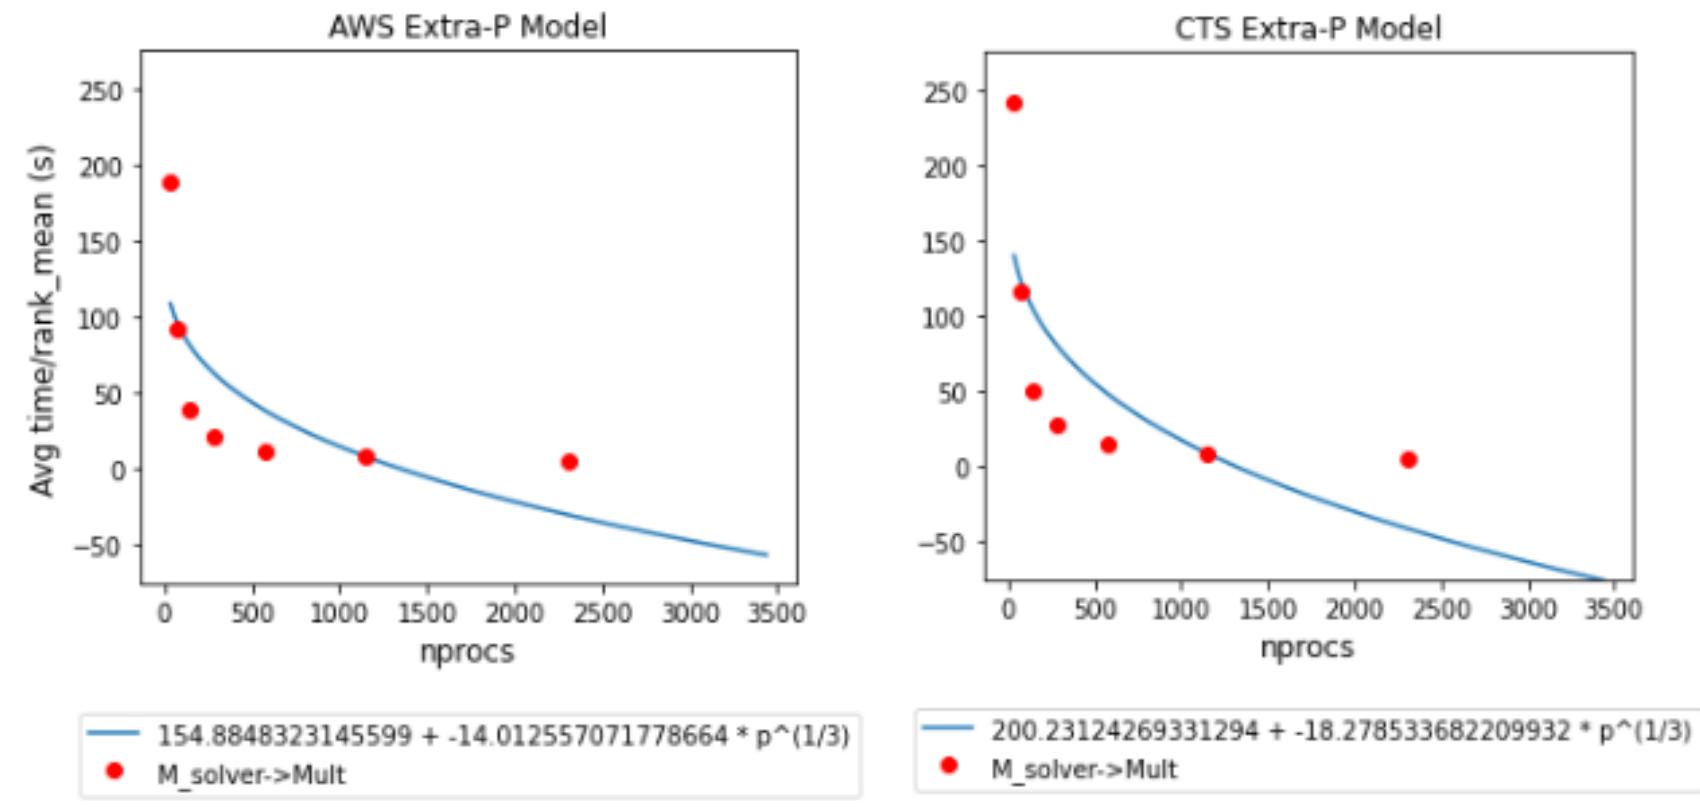

Model: Use third-party Python library, Extra-P

Extra-P derives an analytical performance model from an ensemble of profiles covering one or more modeling parameters

<http://github.com/extra-p/extrap>

- Select functions of interest
- Call Extra-P to model scaling on different hardware types

Visualize metadata with parallel coordinates plot

- Thicket's interactive parallel coordinates plot shows relationships between metadata variables, and between metadata and performance data

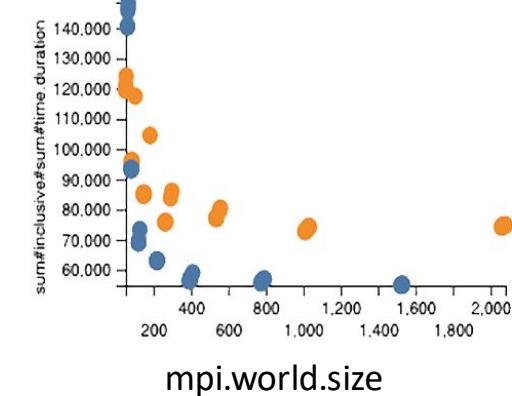

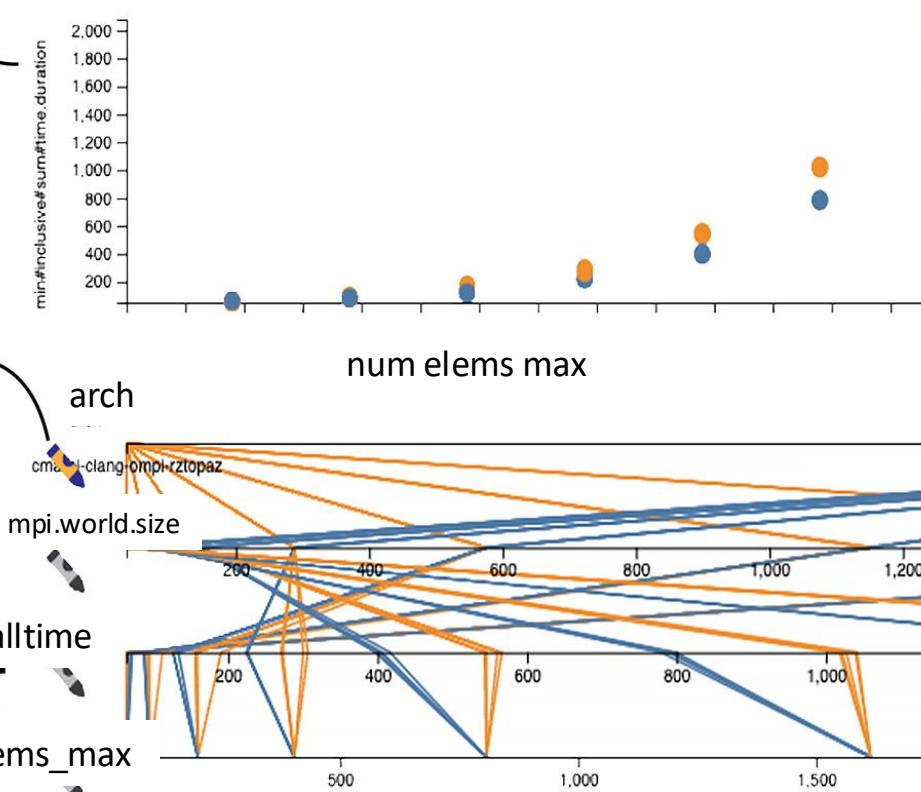

The metric values are associated with one node in the call tree.

Clicking the crayon separates data by architecture

Parallel lines show correlation between program runtime and number of simulated elements

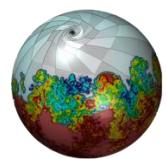

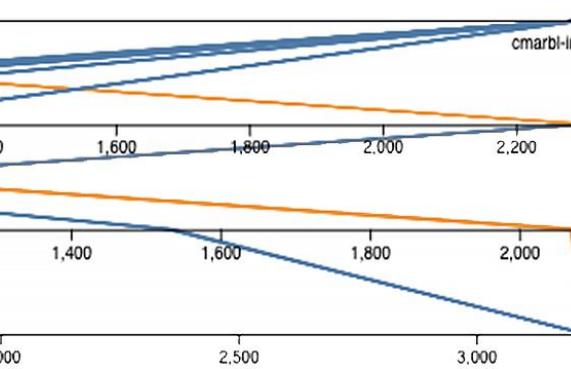

walltime

num_elems_max

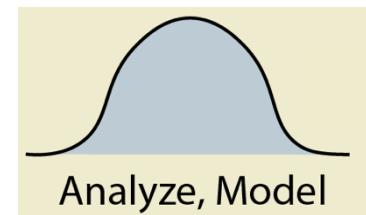

Each point represents a profile. All profiles are currently selected.

Criss-crossing lines show inverse correlation between number of MPI threads and program runtime

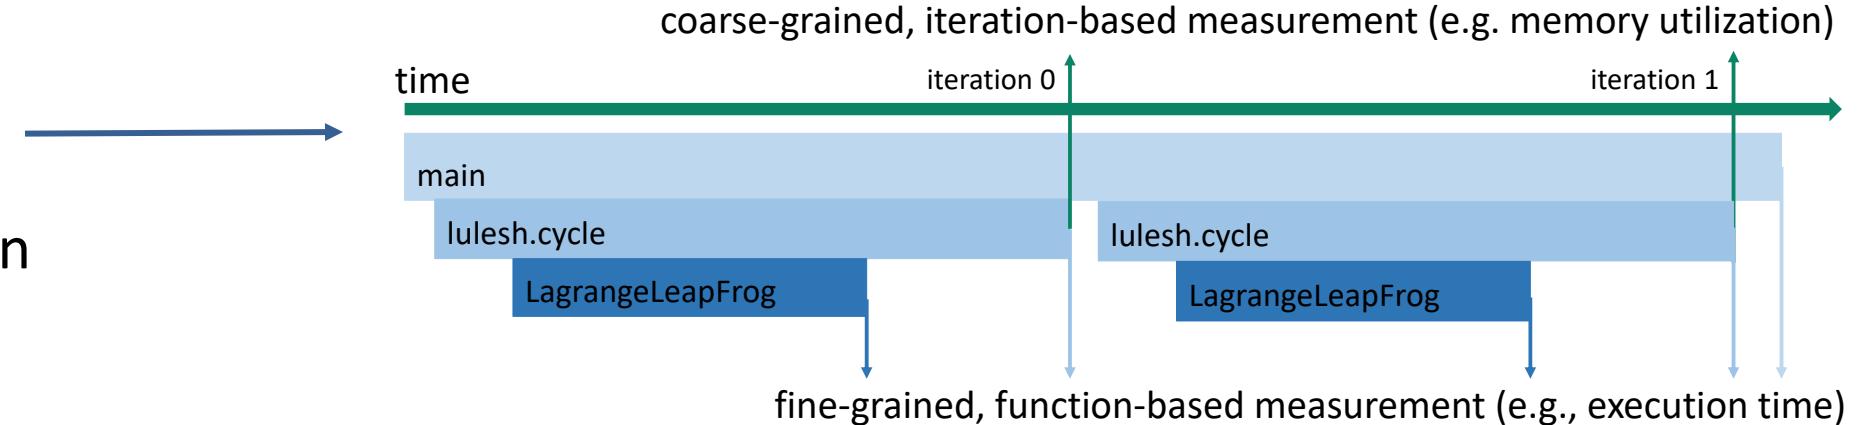

Can we observe performance fluctuations over time?

- Caliper collects metrics at set intervals
- Thicket can then categorize temporal patterns [1]:

$$P_{temporal}(t) = 1 - \frac{\sum_{t=0}^T M_t}{\sum_{t=0}^T \max_{0 < t < T} M_t}$$

Pattern	Constant	Phased	Dynamic	Sporadic
Score	0.0-0.2	0.2-0.4	0.4-0.6	0.6-1.0
Symbol	→	~	↔	↗

[1] I.B. Peng, I. Karlin, M. B. Gokhale, K. Shoga, M. P. LeGendre, and T. Gamblin. A holistic view of memory utilization on hpc systems: Current and future trends. Proceedings of the International Symposium on Memory Systems, 2021.

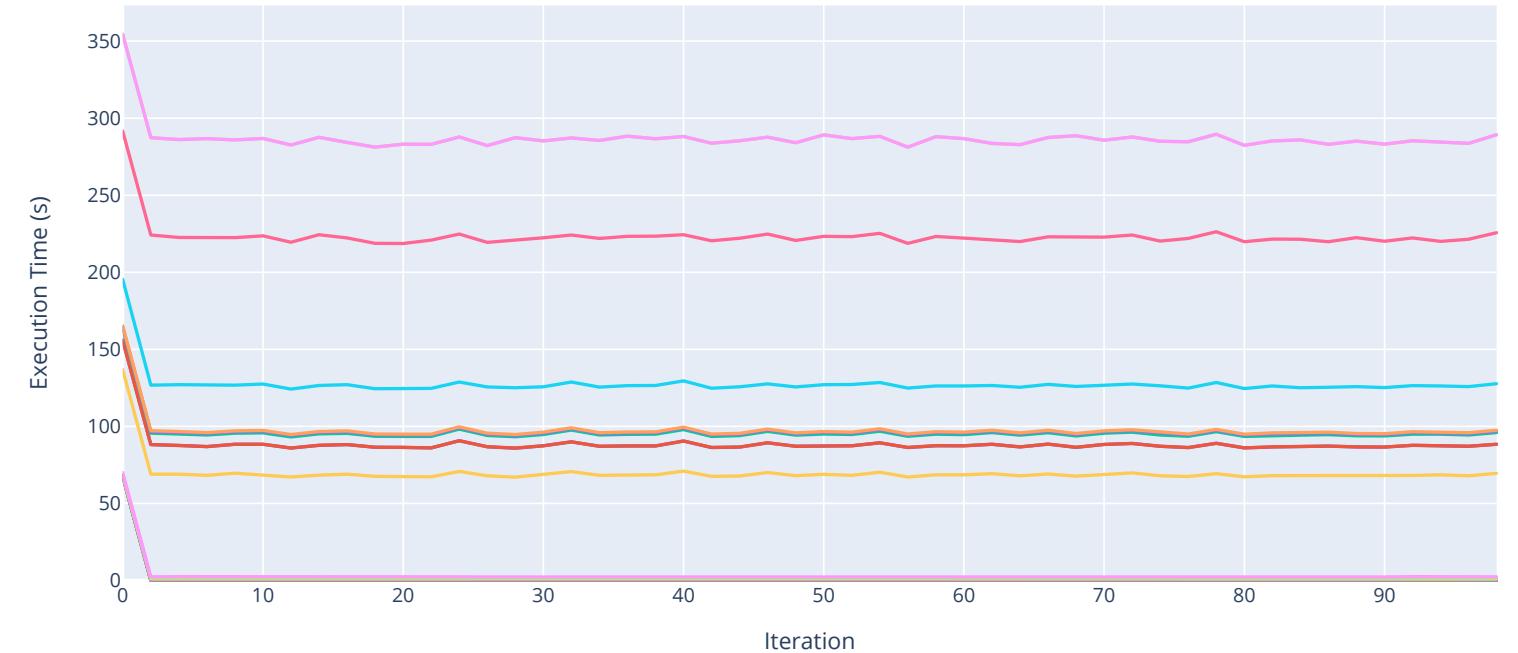

Timeseries metrics visualizations

- Display pattern symbol and temporal score as part of the call tree
- Use python plotting libraries to create a more granular visualization

Reproducible Experiments with Benchpark

Stephanie Brink

We benchmark HPC systems for a variety of reasons

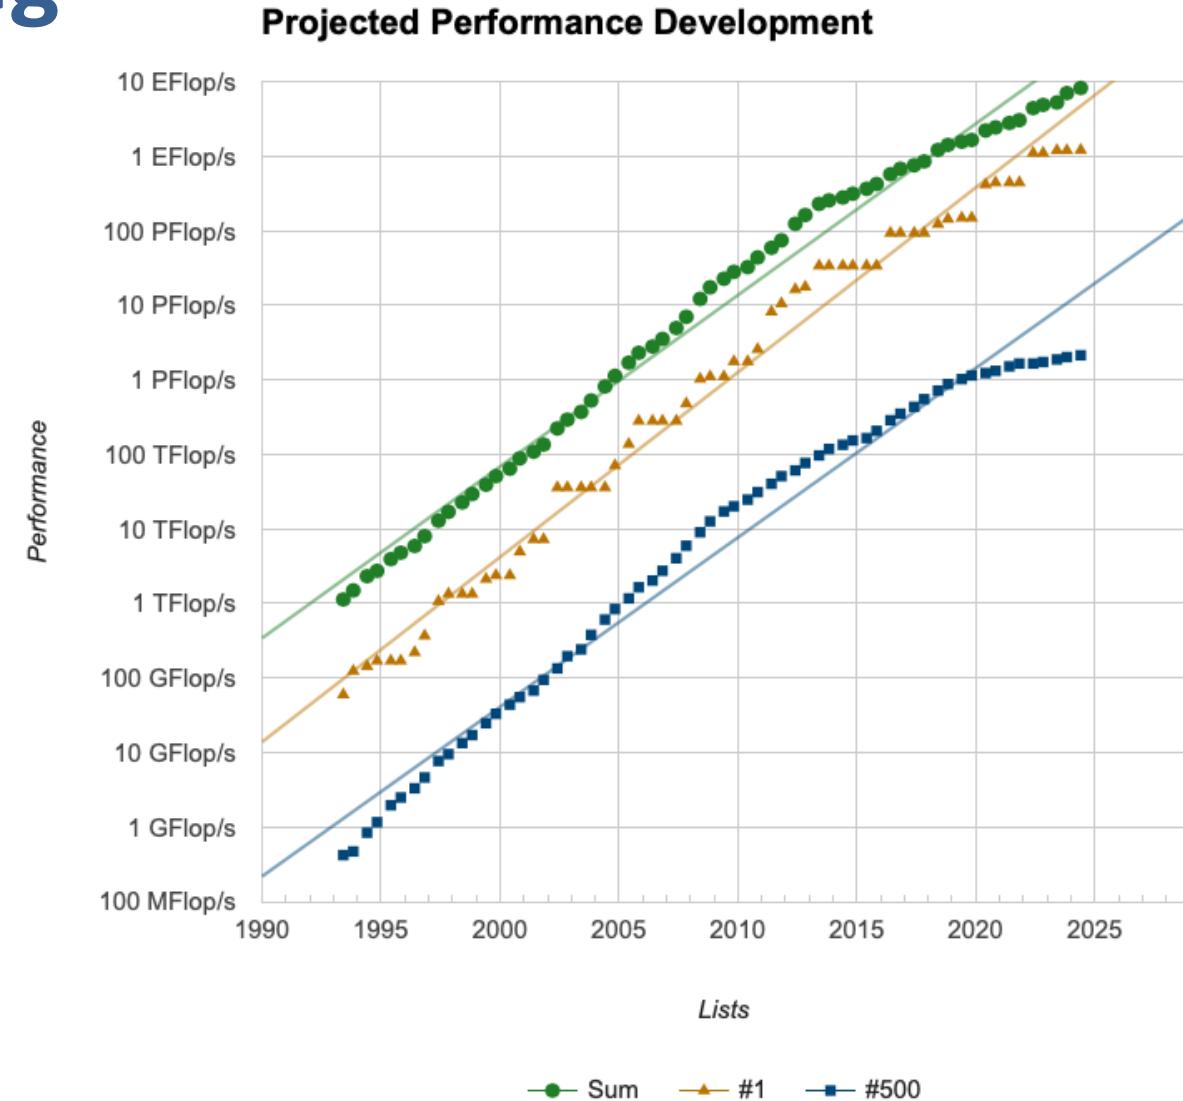

- Procurements
 - Communicate datacenter workload to vendors
 - Co-design systems, monitor progress
 - System acceptance (contractual specification)
- Validation of software stack, tools
 - Compilers
 - Debuggers
 - Correctness tools
 - Performance tools
- Research
 - Programming models
 - Computational methods
 - Performance across architectures

Many stakeholders, communication is key for collaboration

Benchmarking is challenging

- What are we trying to characterize?
- Are we capturing the best the system can do?
- Is something else impacting performance?
- Did we build and run the code in the *optimal* and *reproducible* way?

HPC benchmarks run on diverse HPC systems

Lawrence Berkeley Nat'l Lab
AMD Zen + NVIDIA

Lawrence Livermore Nat'l Lab
IBM Power9 + NVIDIA

Oak Ridge National Lab
AMD Zen + Radeon

Argonne National Lab
Intel Xeon + Xe

- Benchmark source code
 - Abstraction (OpenMP, RAJA, Kokkos)
 - Hardware-specific (CUDA, ROCm)
- Optimized code for the CPU and GPU
 - Must make effective use of the hardware
 - Can make 10-100x performance difference
- Rely heavily on system packages
 - Need to use optimized communication and MPI libraries that come with machines

Writing benchmark source code is only the beginning

State of the practice:
HPC system benchmarking is manual!

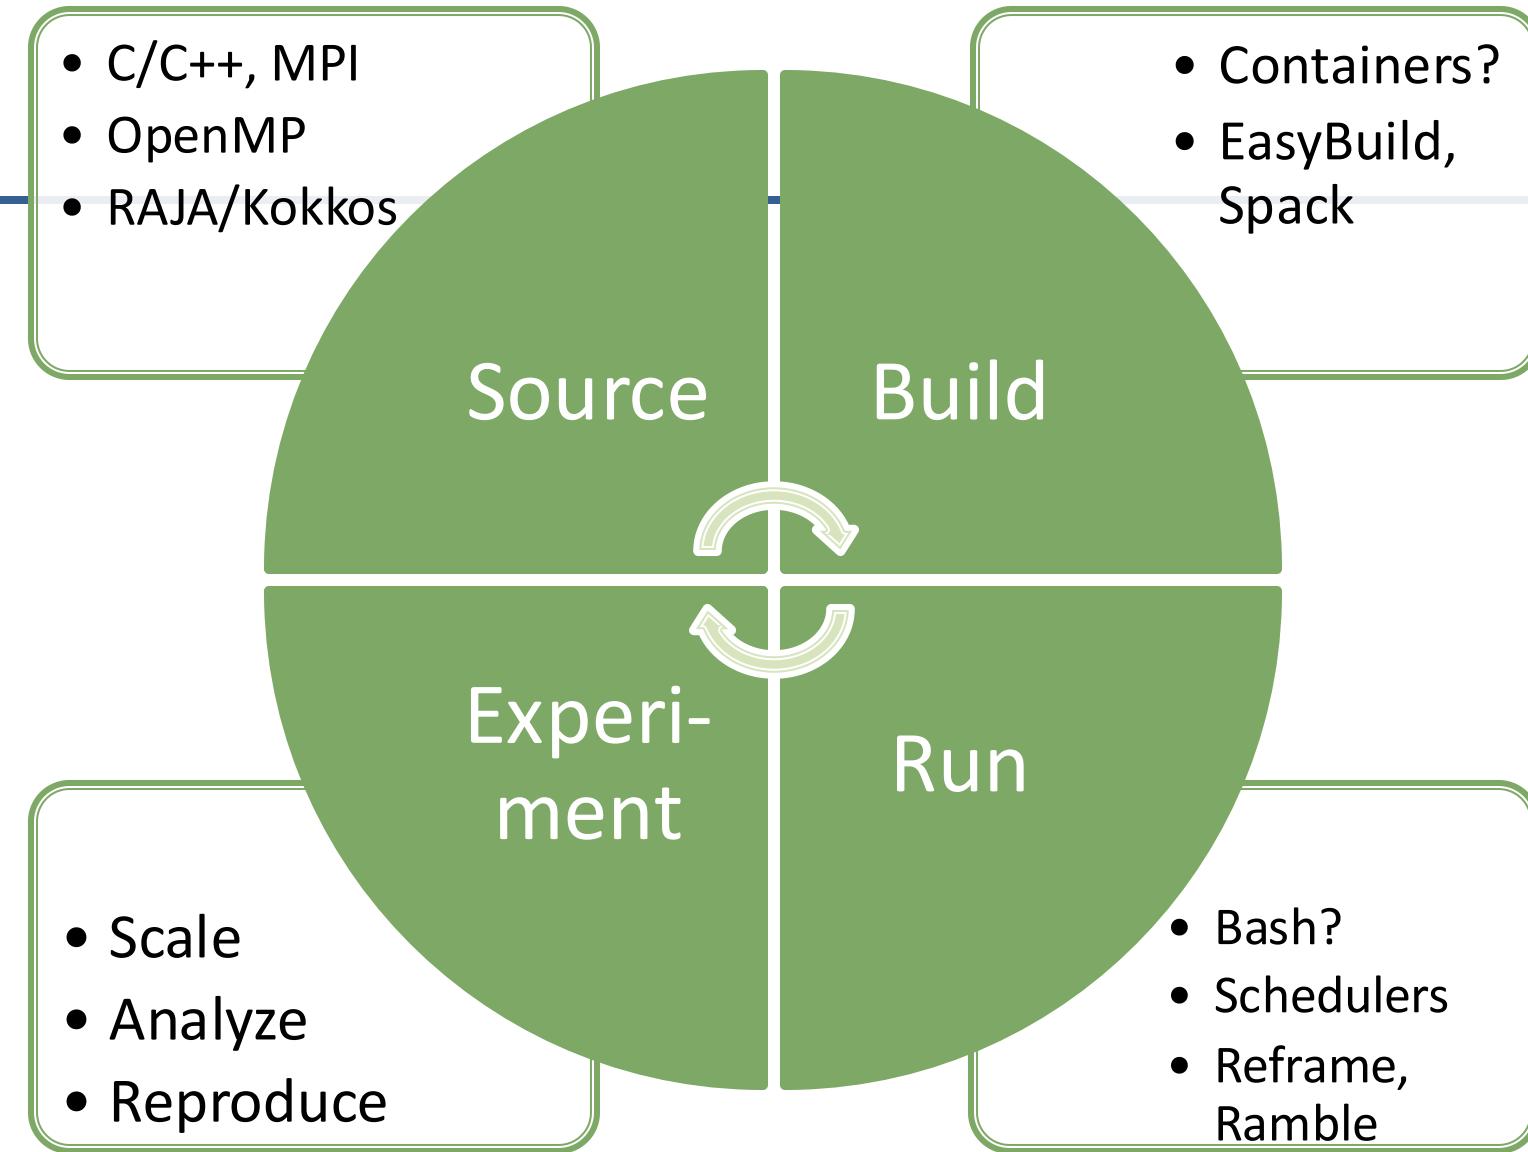

- **Building** on each system is different, porting the builds to new systems is manual
- **Running** on each system is different, porting run scripts to new systems is manual
- Systems keep **changing**, requiring updates to how we build and run benchmarks
- **Triggering** builds and runs is manual: benchmark results don't stay up to date
- **Performance analysis** of results is manual

Communicate technical specification via code, documentation, white papers

HPC Benchmarks are HPC Software

- Portability
- Maintenance
- Testing/CI
- Verification
- Reproducibility

All components must work *for your system*, focus on explainable performance

Benchpark enables complete specification of HPC benchmarks

Infrastructure-as-code benchmark specification codifies:

- Benchmark build and run instructions
- **HPC Systems**
- **HPC Experiments**

github.com/Llnl/benchpark

Leverage advances in HPC automation

- Source code
- Build specification
- Run specification
- CI

Ramble
Spack

Every part of the specification codified: use to communicate, automate

Lawrence Livermore National Laboratory
LLNL-CFRES-2202755

Join #benchpark-support on slack.spack.io

<https://github.com/Llnl/benchpark>

Benchpark enables *reproducible* specifications of benchmarks

Specify

- How to build and run benchmarks on a system

Run

- Run an experiment on a system

Reproduce

- Re-run an experiment on a system

Replicate

- Run an experiment on a new system

Maintain

- CI: Run experiment on HPC systems

Record

- Perf.measurements + *full spec* of experiment

Full specification enables reproducibility, replicability, and automation

HPC System definition for Performance

- Resources (CPU cores, GPUs)
- Scheduler (Slurm, flux)
- Process mapping (cores, sockets, GPUs, NICs)
- On-node parallelism (CUDA, ROCM, OpenMP)
- Software stack
 - Compilers (which is best?)
 - MPI implementations (best?)
 - Math libraries

Goal: Use the system correctly

HPC System in Benchpark: *Specify Once*

HPC Experiment definition for *Performance*

- On-node parallelism
(CUDA, ROCM, OpenMP)
- Problem sizes
 - Overall problem size, or
 - Per node or per GPU
- Scaling studies
 - How to scale
 - How to decompose
- Resources (cores, GPUs)

Goal: Specify reproducible sets of experiments that map onto specific Systems

HPC Experiment in Benchpark: *Specify Once*

```
class Amg2023(Experiment, OpenMPExperiment, CudaExperiment, ROCmExperiment,
    Scaling(ScalingMode.Strong, ScalingMode.Weak, ScalingMode.Throughput,
        Caliper)):

    variant(
        "workload",
        default="problem1",
        values=("problem1", "problem2"),
        description="problem1 or problem2",
    )

    def compute_applications_section(self):
        self.register_scaling_config({
            ScalingMode.Strong: {
                "n_resources": lambda var, itr, dim, scaling_factor: var.val(dim) * scale,
                "problem_size": lambda var, itr, dim, scaling_factor: var.val(dim) // scale,
            },
            ScalingMode.Weak: {
                "n_resources": lambda var, itr, dim, scaling_factor: var.val(dim) * scale,
                "problem_size": lambda var, itr, dim, scaling_factor: var.val(dim),
            },
            ScalingMode.Throughput: {
                "n_resources": lambda var, itr, dim, scaling_factor: var.val(dim),
                "problem_size": lambda var, itr, dim, scaling_factor: var.val(dim) * scale,
            }
        })

```

Benchpark codifies benchmarking steps

- Benchpark does **not** replace benchmark source, build system, or Spack package
 - Benchpark manages benchmark **experiments** and how they map onto **systems** with specified (or default)
 - Compilers
 - MPI/comm libraries
 - Math libraries
 - Start running benchmark experiments on your system with just a few commands
- ✉ git clone git@github.com:LLNL/benchpark.git
 - 🖥 benchpark list systems
benchpark system init --dest=elcap llnl-elcapitan
 - 👤 benchpark list experiments
benchpark experiment init dest=amg
amg2023 +rocm scaling=strong
 - 💻 benchpark setup amg elcap workspace
ramble workspace setup
 - 🐦 ramble on

Who can use Benchpark

People who want to use or distribute benchmarks for HPC!

1. End Users of HPC Benchmarks

- Install, run, analyze performance of HPC benchmarks

2. Benchmark Developers

- People who want to share their benchmarks

3. Procurement teams at HPC Centers

- Curate workload representation, evaluate and monitor system progress

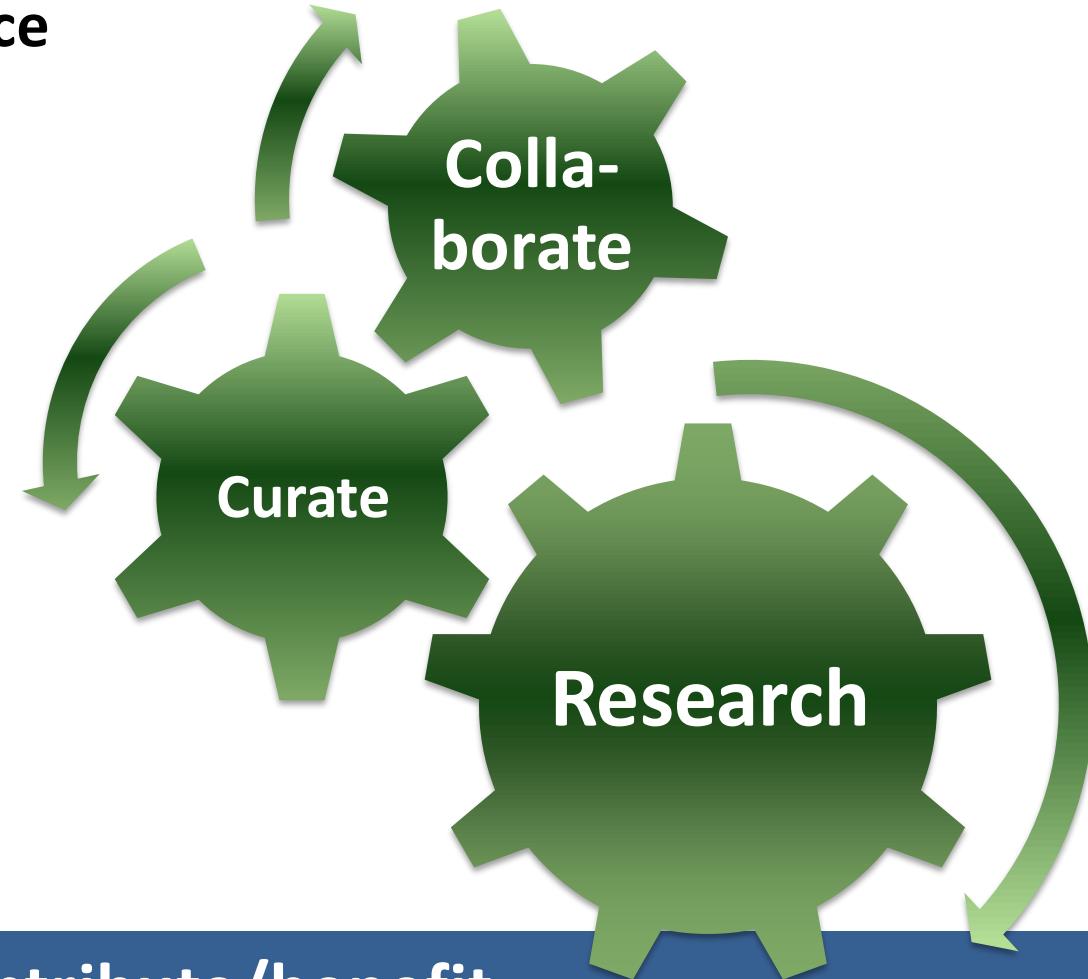

4. HPC Vendors

- Understand the curated workload of HPC centers, propose systems

Catalogued library of *working* benchmarks

- Enables exploration of large configuration space
 - Architectural
 - Software stack
 - Temporal
- What architecture and system configuration is best for *my benchmark*?
- On *my system*, is OpenMPI good enough?
- What purpose will Benchpark help you address?

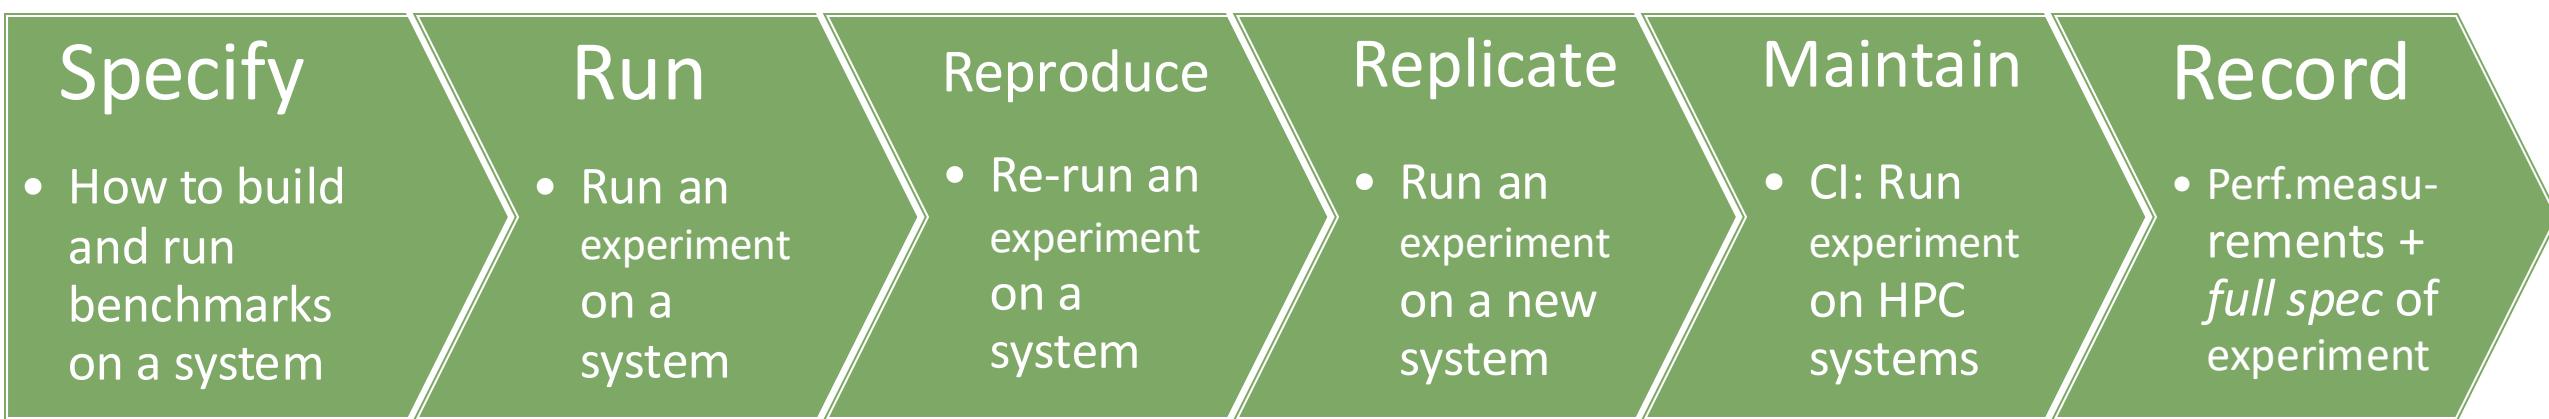

Building a community to contribute/benefit

Benchpark: Open collaborative repository for *reproducible* specifications of HPC benchmarks

Infrastructure-as-code benchmark specification enables **reproducibility, replicability, and automation**

- **HPC Systems**
- **HPC Experiments**

- Tagging, keywords for publications
- Performance metrics, metrics of usefulness
- Dashboards: Archive specs+results

- CI pipelines on PRs from GitHub at data centers across the world and in the cloud

*Olga Pearce et al, Continuous Benchmarking, HPCTests SC|23

*Olga Pearce et al, Repeat, Reproduce, Replicate, ACM REP 2025

Full specification enables reproducibility, replicability, and automation

Benchpark roadmap and community engagement

Future directions:

- Suite curation: Reproducible specification of an entire suite
- Tagging: Keywords for publications, finding benchmarks
- Metrics: Performance, usefulness
- Dashboards: Archive+share *specs+results*, Slices in configuration space
- CI pipelines at data centers across the world and in the cloud

Community Engagement:

- Co-design / vendors on board, but incentive for app teams? (carrot or stick?)
- Who owns which parts of the specification and approves changes?
- Who finances R&D and maintenance?
- ROI for the people working on it? → think about post docs, researchers, etc.

Collaboration, reproducibility, fully specified public results

Benchpark Tutorial Materials

Find these slides and associated scripts here:

software.llnl.gov/benchpark/basic-tutorial.html

We also have a channel on Spack slack.

You can join here:

slack.spack.io

Join the #benchpark-support channel!

You can continue to ask questions here after the conference has ended.

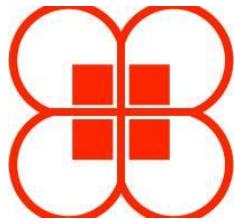

Tutorial Instances: <http://bit.ly/4kGQDlc>

- We have an AWS instance for the hands-on component of this tutorial
- The instance provides:
 - Pre-installed Thicket, Caliper, and Benchpark and required dependencies
 - Caliper source code demos
 - Thicket Jupyter notebooks and datasets for performance analysis

When logging in to the instance:

- Please use a unique username to avoid resource allocation conflicts
 - First initial followed by last name (e.g., jdoe)
- PW: hpctutorial25

Join us after HPDC!

- All tutorial materials
 - software.llnl.gov/Caliper
 - thicket.readthedocs.io/en/latest/tutorial_materials.html
 - software.llnl.gov/benchpark/basic-tutorial.html

- Connect with us on Spack slack
